

VISUALIZING SI UNITS

TEMPERATURE (T, t)

Note: Celsius was formerly called centigrade

The «dummy» temperature is simply a convenient interface between $^{\circ}\text{F}$ and $^{\circ}\text{C}$

In dotted lines: with the arrow ADD; against the arrow SUBTRACT

Examples of temperature conversion:

$$80 \text{ degrees Réaumur} = 80 (\times 1.25) ^{\circ}\text{C} = 100 ^{\circ}\text{C}$$

$$100 \text{ degrees Celsius} = (100 + 273.15) \text{ K} = 373.15 \text{ K}$$

$$100 \text{ degrees Celsius} = 100 (\times 1.8) + 32 ^{\circ}\text{F} = 212 ^{\circ}\text{F}$$

$$108 \text{ degrees Fahrenheit} = (108 + 459.67) \div 1.8 \text{ K} = 567.67 \div 1.8 \text{ K} = 315.372 \text{ K}$$
